Abstract (en)  
[origin: WO9515106A1] The juice extractor is installed on the uniform base (1) on the circular section with the rectangular protrusion. On the circular section the housing (2) is mounted containing the motor (3) with the coupling (4) above which the basin (5), equipped with the antivortex element (7), is mounted. The flexible elements (8), adjacent with their perimeters to the side surfaces of the basket (6) and the coupling (4), are fixed between the basket (6) with the cutter disk and the coupling (4). On the cylindrical part (10) of the cover (9) the adjustable chute cone (11) is mounted. The discharge container (13) rests on the rectangular protrusion of the base (1), and, being adjacent to the housing (2), creates with it a solid having an oval intersection with the bevel from the top of it.
