Abstract (en)

[origin: EP0732462A1] To the ridge, etc. region caps (2) is allocated a resilient sealing material (16), bridging over the gap to the roofing material edges. The sealing material is air permeable and pref. contains mutually movable elements. Typically the air permeable material is formed by a metal fabric, a metal mat, wire mesh, wire element, or an element with metal platelets. The material may be an ion releasing metal. It may deform by gravity when deposited on the roofing material. The cap has longitudinal edges carrying the sealing material.
