Abstract (en)

[origin: EP0732714A2] The speed of a hand held electrical tool is regulated by a switch unit that is built into the hand grip. The switch module has a housing of plastic and a push button actuator connects with a pin and this operates to turn the motor on and can be adjusted to vary the speed. The speed control is provided by an electronic control module that is connected to a power semiconductor regulating the current supplied to the motor. The power semiconductor is in contact with a carrier and this connects via an aperture in the housing with a heat sink plate mounted on the side of the housing. The plate is located on mounting studs.
