Abstract (en)

[origin: WO9516505A1] The invention relates to a shoe support plate, particularly a support plate associated with a downhill ski boot binding element. In the cross-section area, the support plate presents a medial region (7) with lateral regions (8, 9) on either side. The plate is characterized in that the central region is relatively rigid and the lateral regions are elastically deformable. The regions are covered with a flexible plate of anti-friction material (10).
