Abstract (en)
[origin: WO9515982A2] The present invention relates to a method for generating an antibody which is specific for an immunorecessive epitope, and nucleic acid encoding the antibody. The subject method generally comprises the steps of generating a variegated display library of antibody variable regions, and selecting from the library those antibody variable regions which have a desired binding specificity for the immunorecessive epitope. The antibody variable regions used to generate the display library are cloned from an immunotolerance-derived antibody repertoire.
