Abstract (en)
[origin: WO9514152A1] Proposed is a louvable roller blind with at least one traction chain whose links are jointed to each other and to swivelling lamella-like strips plus at least one adjusting chain whose links are jointed to each other and to the lamellae. The blind is mounted by means of the traction-chain links in fixed guideways. The lamellae (1, 2) overlap the traction-chain links (4) and the adjusting-chain links (3) overlap the lamellae (1, 2). The joints between the traction-chain links (4), those between the adjusting-chain links (3) and those between the lamellae (1, 2) and the traction-chain and adjusting-chain links consist of hook-shaped connectors (7, 21; 8, 11; 14, 15; 16, 17; 42, 45; 43, 44). At each end of the lamellae (1) is an additional piece (2) which has along its upper longitudinal edge a joint element (7) which connects it to its associated traction-chain link (4) and along its lower longitudinal edge a joint element (8) which connects it to its associated adjusting-chain link (3). The lamellae (1) are hollow and the additional pieces (2) are designed as slide-in components which are partly inserted into the lamellae (1).
