Abstract (en)

[origin: WO9516206A1] The present invention relates to a biosensor composition comprising a binding element, associated with a lipid membrane, in combination with a signaling element to qualitatively or quantitatively detect an analyte in a mixture. The composition is arranged so that binding of an analyte by the binding element produces a measurable change in the signaling element. The composition may optionally contain an intermediary element to couple the response of the binding element to the signaling element through intermediate chemical reactions.
