Abstract (en)

[origin: EP0733416A1] The wire mesh reinforcing mat consists of longitudinal and transverse rods welded together. First of all, only the longitudinal rods reaching the most forward transverse rod position in the forward feed direction are laid, and then the rest of the row after this as they reach by their front ends the successive transverse rod positions. The remaining longitudinal rods are only laid if the transverse rod position pre-allocated to its forward ends reaches the welding machine.
