Abstract (en)

[origin: EP0733478A1] The rotary body can be a cylinder or roller for an offset rotary press. The coolant goes in and comes out on the same side through a journal through which the inflow line passes in the middle before being connected to a temp. control chamber on the jacket side, coming out in into the outflow line which is an annular fitting in the input line. The two journals (4,5) of the cylinder body (1) can be connected at either side to the coolant connection (11,22) or may have an outwardly sealed lock (8). The inflow line (14) and the coolant line to the temp. control chamber (17) is variable to maintain the guaranteed temp.
