Abstract (en)
[origin: EP0733574A2] The sheet stack processing device has a pneumatic control (17) for each movable closing member (19) to delay and spread the sheet stacks, in the control surface (26) of which there are two control apertures (23). Between the apertures there is an additional sliding surface (40) for the graphite closing member. Individual closing members (20) serve to locate the position of the control and the apertures. The closing members slide up to a sieve. The working field defines the sheet stack plane (10) and the working width and length. The through passage, controlled by its own closing member, defines a narrow through passage circle.
