Abstract (en)
[origin: EP0733867A2] The device has two support forks (4) for supporting the radiator (1) underneath and has hooks above for holding back the radiator. Both support forks form one support element (5) which is fixed to the wall (2) and has a circular formed seat (6) having a rotatable fastening element (7). The fastening element is composed of two half elements (7',7'') which are mirror images of each other and are in the form of horseshoes having an opening (8) in which a cylindrical formed support area (9) of the radiator is positioned. The two halves are rotatable against each other so as to form a vertically upwards opening for the support area of the radiator which is inserted into the opening vertically from above and hooked onto the upper hooks.
