Abstract (en)

[origin: EP0734711A1] The seal has a selector ring (4) positioned for free rotation w.r.t. the cap and formed integrally with hinged sections (4a-b) on the interior of the cap. The sections are positioned diametrically opposed and are moved by contact with the selector ring into engagement with the walls of the teat. The sections can be formed by tongues hinged at their bases to the inside of the ring and carrying a head (4a3-4b3) which is profiled to contact surfaces (5a-b) inside the protector cap. the contact surfaces form positioning guides for the selector ring.
