Abstract (en)

[origin: EP0734785A1] The device has an unbalance body with inner and outer unbalance mass (8,10,7,9). Inner and outer mass are each driven by a continuous drive body (4.1), e.g. a toothed belt, which in turn is actuated by a central motor drive (4). At least one belt has an associated adjuster (15,16,17). This applied an additional movement to the belt, superimposed over its drive movement, for relative turning of inner and/or outer unbalance mass. The belt for the inner unbalance mass moves in the opposite direction to that for the outer mass. The central motor drive is translatory.
