Abstract (en)
[origin: US5732521A] Longitudinal or transverse supports for a ceiling panelling holding construction of T-shaped, bent sheet metal plates and ceiling tiles connected to said sheet-metal plates are supposed to be strong and at the same time, however, be of a light weight. The grooves of the surface image are thereby supposed to be very narrow and are supposed to be formed, instead of by the supports, rather by the ceiling tiles themselves, which are supposed to be designed individually capable of being assembled and disassembled. The invention uses for this purpose specially built supports, into which the ceiling tiles can be suspended, which, however, can also be set up to support such ceiling tiles.
