Abstract (en)  
[origin: EP0735220A1] The lock housing (4) has an associated operating member (7) which enters into action with the coupling member (6) in a defined position of the spring bolt. Any change in the operating member releases the connection between the bolt tail (2) and the slide member (3). The operating member is designed as a slider (7) guided on the back wall of the lock and engaging with a projection (8) in the retracted position of the spring bolt. The coupling member is guided on the slide face and engages in a recess of same when the connection is released.
