Abstract (en)
[origin: EP0735338A1] The radiator is especially of the tubular type, with at least two similar base elements (G1,G2,G3) which are arranged beside one another. The elements are welded to one another in their head and foot regions in order to form a circuit, or are connected by nipples (N) in order to make gastight and liquid-tight seals. The heating circuit flows into the radiator at the foot of the first element (G1), and leaves at the foot of the second element (G2). The opening between these elements is closed by a disc (1), which is pressed against the surrounding edge by a separator (2). The separator acts against a sealing plug (VS) which is screwed into an internal thread on the opposite side.
