Abstract (en)
[origin: WO9612421A1] The invention relates to an applicator case for solidified product comprising a tubular body (1) wherein is movably mounted a support (3) formed of a cupel (3a) intended to receive the product and of a prolongation (3b) extending opposite to the product, said support having guiding means which are in the mesh with conjugated means provided in the body and in a hollow base mounted rotationally on and with respect to said body (1) and wherein the prolongation (3b) may extend at least partially so that the rotation of the base causes the displacement of said support within the body according to a motion having at least one translation component. The case of the invention is characterized in that the conjugated means of the support (3) and of the base (2) comprise rotationally engagement and translationally guiding means (11a) while the conjugated means of the support and of the body (1) comprise conjugated screwing means (18; 8a) so that the rotation of the base causes the screwing or unscrewing of the support (3) into or out of in the body (1).
