Abstract (en)  
[origin: EP0736312A1] The snow shoe has a peripheral wall and walls which define a frame that rests on the snow. Its upper surface has a central longitudinal edge (18) with inclined lateral surfaces (21a,21b) that converge towards the top and the vertical plane of symmetry (P). The inclined surfaces have transversal walls (22a,22b) which extend upwards and extend from a central flat surface (20). They are perpendicular to the plane of symmetry. The boot, or its bindings, rests on the upper surface of the transversal walls.
