Abstract (en)

[origin: EP0736657A1] The handle (3) turns on a pivot axle (4) at right angles to the casement or leaf plane and fits into a fitment (7) driving the locking gudgeon. The fitment moves along a groove (9) on the casement or leaf. The handle and fitment are connected by a deflector gear (12) converting the turning movement of the handle into the lengthwise movement of the fitment. A swivel lever (16) is connected to the pivot axle, and a thrust lever (17) is joined to the fitment.
