Abstract (en)

[origin: EP0736658A1] The corner joint for metal door and window frames in question consists of an external body (4) substantially shaped as a right-angle, having an internal cavity inside which a flexible control strip (8) slides and having, at the lower end which is positioned on an upright, a connecting part or block (2) integral with the said flexible strip (8), having a locking pawl (3) for intermediate locking and a protrusion (9) which allows one side only of the block (2) to be inserted in a guide in the upright; when the door or window is opened and closed, the connecting part or block (2) travels between two limit configurations: open (I) and closed (II); the external body (4) has a projecting section (6) which faces downwards and projects outwards in such a way as to fit over the joint (7) in the closed configuration (II), thus preventing it from flexing or turning. <IMAGE>
