Abstract (en)
An orientation device applied to a lighting apparatus comprising a fixed support (1) to which is attached in a rotatable manner a mobile support (2) comprising a plate (3) and an ogival wall (4) to the inside of which a spotlight (5) is fixed. The rotatable connection (7) between the mobile support (2) and the fixed support (1) makes it possible to extract the first from the second. The fixed support (1) comprises an external ring (8) in which an internal ring (9) engages circumferentially in a sliding manner. To the internal ring (9) is fixed the end (11a) of a flexible curved rod (11) which engages in a frictioned sliding manner in a vice (13) that is integral with the mobile support (2). The extraction movement is easily carried out from the outside of the lamp without having to dismount the light or intervene on the locking means. <IMAGE>
