Abstract (en)

[origin: EP0736745A1] The filling device forms layers (40) of sub-projectiles (20) before filling. These layers are equal in thickness to the length of the sub-projectiles. They run in planes across the axis of the shell body. In the layer, they adopt a position in accordance with their geometrical positioning in a cavity (42) in the shell body. The circumference of the layer is formed during assembly so that the sub-projectiles maintain their position without being able to turn. The shape of this circumference may be a regular hexagon, so that the cylindrical sub-projectiles have their axes running parallel to the longitudinal axis of the shell body.
