Abstract (en)

[origin: EP0737428A1] The jewellery, such as a ring or bracelet, has an external ring which is able to turn between two lateral annular edges of a concentric internal ring. The internal ring is constituted by a soldered assembly of two half rings of the same diameter, the same external configuration and same axial length. Each half ring is formed from an annular part (3,4) comprising, from an end edge, a bulge (3b,4b) which forms a side retaining strip for the external ring. They also have a cylindrical annular part (3c,4c) able to engage in the external ring. Each of the annular parts, at its opposite end edge, has a tubular part (3e,4e) of reduced thickness relative to the thickness of the annular cylindrical part. The reduced thickness parts extend from the internal surface (3a) and from the external surface of the cylindrical annular parts. They thus define, when the two annular parts are abutted to form an internal ring, an internal annular cavity able to receive the solder.
