Abstract (en)

The shutter winding mechanism consists of two parallel shafts (2,3) situated above and in line with the shutter (1). One shaft (2) is connected to a drive (5) while the other (3), linked kinematically to the first, is able to turn freely at a slightly different speed to it. The mechanism is equipped with separators for the layers or coils of the shutter when they are wound onto the shafts, made in the form of stepped pulleys (6) with sections (6a-c) of different dia. on the shaft ends, and cylindrical tips (60-62) of different lengths which project from the ends of the shutter slats.

Abstract (fr)

Dans le cas où le tambour pour l'enroulement des lames (10) du tablier est formé par deux arbres superposés (2 et 3) on prévoit des moyens de séparation aptes à éviter toute friction entre les couches de lames enroulées sur lesdits arbres. Ces moyens peuvent notamment comprendre des poulies étagées (6a, 6b, 6c) associées à des embouts (60, 61, 62) de longueurs différentes. <IMAGE>
