Abstract (en)

[origin: EP0737840A2] On the object (1a) at least one shape component (2) and/or a surface component (3) is unfoldably arranged, which in the unfolded state object-typical characteristics such as installations (4) of the bodywork, super-structures (5) and drive unit (6) are covered and which are so formed that even by multi-spectral observation the signature of another type of object (1b) is recognisable. The formation of the shape and/or surface component (2,3) determines the choice of the surface material, the properties of the visible surface material as regards colour, emission capability and reflection capability.
