Abstract (en)
[origin: EP0738805A1] The connector casing (10) consists of side walls (14, 16) and front walls (18, 20) for fitting onto a window frame (12). On the housing's inner room walled edges of the side walls are cover strips (22) used for squeezing in a vapour screen foil (28). There are u-shaped recesses present on the cover strips which, ideally on the edges of the side walls, accommodate the vapour screen foil. The side walls are arranged, at the very least, inclined to base plate (12) of the window frame in the vicinity of the inner room that is connected to the walled end section of the walls with connector elements (24, 36) that from a right angle with the base plate of the window frame, and disguised elements (34) from the inner room. The cover strips run parallel to the housing wall's receptors for the disguised elements.
