Abstract (en)
The invention relates to a gate for closing a passage, whereby said gate is provided with a carrier and with railings (2) or the like closing means connected to said carrier. The carrier movably couples the gate to a support by means of rollers (3) connected to said support, in such a manner that the gate can be opened and closed by moving the carrier relative to the support. The carrier is built up of two vertically spaced-apart beams (4,5) extending substantially horizontal and parallel to each other, and being interconnected by means of plate-shaped parts (6,7) symmetrically positioned on either side of said beams (4,5). The plate-shaped (6,7) parts are spaced-apart in a horizontal direction, at least over part of their height, by a distance which is larger than the width of the beams (4,5). The rollers (3) are mounted on the support in such a manner, that said rollers (3) roll on the upper side of the upper beam (4) and on the bottom side of the lower beam (5) respectively. <IMAGE>
