Abstract (en)
[origin: EP0738838A2] The damping device has an attachment element (10) with head (18) and shaft (20). There is a casing (14) which has a device for fixing it to the part to be damped, and a receiving aperture. The casing contains a clamping element (16) which has a radially movable or deformable clamping sector (60). The clamping sector engages with the shaft of the attachment element, which can be inserted through the receiving aperture in the casing. A carrier element (12) can turn on the casing in the region of the receiving aperture. It has a through passage for the shaft, and ramp surfaces (96) which act with the clamping sector so that the shaft is firmly held axially in the casing.
