Abstract (en)

A wire decurling apparatus (100) occupies a minimum of space and has two interconnected subassemblies (1, 2) which are hinged together so that the upper subassembly (2) may pivot with respect to the lower subassembly (1). Each subassembly (1, 2) has a plurality of rollers (11, 11') arranged therein which are shifted in two directions with respect to each other, thus subjecting the wires to both to vertical and lateral bending simultaneously while passing through the apparatus (100). <IMAGE>
