Abstract (en)

[origin: WO9516230A1] Pot detection, determination of type of pot, and determination of a fault condition may be performed by suitable signal processing and statistics on the measurements of thermal radiation from the top, possibly vitroceramic, surface of a cooking zone. The measurements are converted to indicators of thermal load over time on the radiating elements and classified according to stored limits possibly determined during calibration runs. The power supplied to the heating elements is used as a correction factor.
