Abstract (en)
The closure clamp is supported via a first roller component (28) on a support edge or surface (26, 61) acting as clamp counter bearing. The support edge or surface evolves from a closure piece (14) connected with the cheek rail (10). The closure clamp (18) penetrating the closure piece (14) has a second roller component (36). The second roller component is accommodated by a guide (42) running in a slide component (16) activating the closure clamp. The guide has a horizontally running section (44) and a further section (40) at an angle to it and turned away from the points tongue. Before locking, the further section is supported on a support surface (46) which forms a limiting surface. This surface is part of the angled section.

Abstract (de)
Die Erfindung bezieht sich auf ein Verfahren und eine Vorrichtung zum Verriegeln einer Weichenzunge (12) mit einer Backenschiene (10) mittels einer Verschlussklammer (18), wobei die auf die Verschlussklammer einwirkenden Kräfte P2, P3, P4 beziehungsweise die Verriegelungskräfte P7 kontrolliert einstellbar sind. <IMAGE>
