Abstract (en)

[origin: DE4401833A1] The invention relates to a locking system comprising a lock (1) and a number of keys (49, 53) which fit one lock. The appropriate keys (49, 53) which can be inserted into the lock channel have differing lock codes which actuate the locking mechanism of the lock (1). It is proposed that, in order to improve the security of the lock, each lock code should have allocated to it its own unique independently operated lock mechanism (15, 16).
