Abstract (en)

[origin: EP0741029A2] A colour printing process has the print quality continuously monitored to generate data (M) that is processed to generate an average value (M1). Changes in the values are used in an identification process where the type of response characteristics (A) is determined and the time required for the system to respond to a correction can be accurately determined. This allows a prediction to be made of when the system will be outside of a defined tolerance band and allows a correcting operation to be generated.
