Abstract (en)
[origin: WO9616888A1] A revolving mandrel holder (16) is capable of intermittent angular movement about an axis (X-X) inclined at an angle of 45 DEG to the direction (f) of advance of the web material (N) being wound; said mandrel holder (16) carries two winding mandrels (12, 12A) on inclined axes relative to the axis (X-X) about which the mandrel holder (16) moves, so that at the end of each roll winding cycle an angular movement of the mandrel holder (16) brings a free mandrel into the winding position (12), and brings the mandrel with the roll (R) formed upon it into the position (12A) in which the roll can be taken off the mandrel that formed it. A plurality of lines (A, B, C) may be arranged side by side.
