Abstract (en)

[origin: WO9508605A1] A low-energy, non-polluting method for reducing waste, and associated plant, are disclosed. Waste such as worn tyres, lead-acid batteries, old oils, sawdust, papers, rags, plastics, etc. are recycled directly as industrial quality secondary products or indirectly by reaction with the decomposition vapours of the above. A plant for implementation of said method will consist essentially of a large multi-wall furnace under different stages of vacuum, heating elements and one or more fluid ring pumps providing a reaction with the volatile matter. Continuous processing can be achieved by associating liquid waste with divided solids. A high temperature device breaks down the complex volatile matter and backscatter. By combining several units, chemical and synthesis reactions are possible.
