Abstract (en)  
[origin: EP0742539A1] The system contains a radio alarm centre (1), at least one signalling device (2), an activation device (3), at least one hand-held transmitter (4), at least one external signal generator module (6), a communications device (5) and at least one emergency warning module (28). The alarm centre is connected to the signalling and other peripheral devices via bidirectional communications channels. Warning and fault signals can be passed to an addressed personal circuit via the communications device. External warning can also be achieved via the external signal generator module. Further positions can be informed in emergency situations to enable initiation of defined auxiliary functions.
