Abstract (en)

[origin: EP0743099A1] The dispenser comprises a container (2) with a body (3) with a closed bottom (4). It has a conical neck (5) with large and small sections. The large section is attached to an end (32) opposite the container bottom and the small section is attached to the neck (6). A distributor pump (7) mounted on the neck communicates with a distribution orifice (92). A distributor activator (9,10) causes distribution of product measures from the container. During use the neck extends outwards from the container and the conical section extends into the container body. In this way the neck and a part of the distributor are housed inside the conical section. The distributor pump has a travel (h) and is fixed to the neck by a fixing ring (8) having a height (H). The neck has a height (D) equal to that of the pump travel increased by the height of the fixing ring.
