Abstract (en)

[origin: EP0743474A2] A device for starting an operation dependent on the angular position of a shaft has an adjusting disk (20) with a deformation body (22) located and able to rotate on the base element (10) on the shaft. The deformation body is located in a flexible ring (30) with external teeth. The teeth (32) on this ring mesh with internal teeth (41) of a ring gear according to the deformation produced by the body, and the two meshed gears have a differing number of teeth. The starting plate (40) is driven with the external ring gear via the meshing of the flexible pinion.
