Abstract (en)
[origin: US5752728A] PCT No. PCT/EP94/03796 Sec. 371 Date Aug. 13, 1996 Sec. 102(e) Date Aug. 12, 1996 PCT Filed Nov. 16, 1994 PCT Pub. No. WO95/21980 PCT Pub. Date Aug. 17, 1995 An alarm-triggering locking mechanism for the lock and/or hinge area of a door to be secured or a window to be secured is proposed, which is embodied as a locking plate (23) which can be attached to a door or window frame by means of holding screws (27) embodied as the first blocking device. A second blocking device, which is harder to overcome by the effect of force, is embodied as at least one striker element (25) rigidly connected with the locking plate (23) and which, following the limited movement of the locking plate (23) in the opening direction, comes to rest against a counter-striker element (26) anchored on the door or window frame. An alarm, in particular a silent alarm, is triggered via radio or the telephone net after the first blocking device has been overcome. The burglar is thereafter delayed by the second blocking device, which makes it possible for security forces to reach the location of the break-in and to arrest the burglar while the break-in is still in progress.
