Abstract (en)
[origin: EP0744504A1] At least one pump (26) has at least one stoppage material collecting chamber (20). This is connected via a lower (40) and upper flap opening (38) and a connecting conduit (24) with the collection container. A dividing flap (22) for each flap opening partly closes the flap opening when the collection container is full and frees it when the pump empties the collection container. The delivery flow of the waste water (15), produced when the collection container is emptied, is pumped via the connecting conduit, through the flap openings and through the stoppage material collecting chamber.
