Abstract (en)
[origin: EP0744512A1] A strip (12) running parallel to the side face of the window frame (14) is connected to the hard foam moulded body (11) of the insulating part (10). After installation in the roof surface, the strip aligns flush with the counter slat which is cut to the length of the window recess. The strip adjoins the counter slat at the end side with force-locking engagement. The strip has an overhang projecting over the window frame at the top so that between the overhang and surface of the insulation is a recess which draws off condensation and serves for ventilation. The strip can be made from a multi-laminated wood, duroplastics or the like.
