Abstract (en)

[origin: WO9522691A1] A method for supplying a gaseous fuel (4) to a combustion engine (3) is described, wherein a required fuel flow is calculated, an actual fuel flow is measured, and a fuel flow control signal is adapted if a difference between the required and actual fuel flow is detected. The fuel flow may be measured using a differential pressure measurement. The fuel flow control signal and associated actual fuel flow may be stored in a continuously updated memory. The invention also provides apparatus for carrying out this method, comprising a pulse width modulation valve (9) arranged in a fuel line (7), fuel flow measurement means (45, 50) arranged downstream of the valve (9), and means for generating a control signal for the valve (9). The control signal generating means are supplied with feedback from the flow measurement means (45, 50) and comprise a continuously updated table (52) for storing control signals and associated fuel flows.
