Abstract (en)

[origin: EP0745737A1] The steel anchor has, at both ends, successive flattened indentations (6) spread over the anchor length. The depth of the indentations corresponds to the wall thickness (S) of the anchor. The indentations can be formed on alternate sides. They are wedge- shaped tapering in the direction of the load (8). The mutual spacing between the indentations corresponds to half their length. The anchor can have small holes (14) in the area of the indentations to exclude air inclusions during assembly.
