Abstract (en)  
[origin: EP0746005A2] The switch has a contact pad on a fixed carrier 24 that is selectively engaged by a contact on a movable carrier 26 that pivots about a point. The motion is produced by a manually operated rocker 18 that is supported on a central spindle 1. One end of the rocker engages an angled surface 17 on an element 20 that can pivot a small amount and is located against a spring loaded slide element 16. This moves and causes a spring loaded element 14 to displace the movable contact carrier to open the contacts.
