Abstract (en)

[origin: EP0747132A2] The applicator has a material storage chamber (4), which is located between feed connection (2) and ejector nozzle (6), in material flow direction. The chamber has an associated volume adjuster. When the pressure in the incoming material rises, the chamber volume is increased, and decreased, when the pressure drops, to compensate for pressure variations in the material. The volume adjuster has a displacement body. This forms part of an inner chamber wall, and is maintained in a central position by a pretension unit, when the material is at normal pressure. The body is a needle (22), which engages on a seat (24) near the chamber intake.
