Abstract (en)
[origin: EP0747216A2] The control system has a processor station (1'-5') associated with each operating unit (1-5) of the machine, with a communication bus (6) linking the processor stations for precise synchronisation of respective switching procedures for each operating unit. A further bus (8) is used to provide each of the processor stations with angular position information from an angle indicator associated with a rotating component at one of the operating units, for synchronisation of the switching procedures.
