Abstract (en)  
[origin: DE19521082C1] The lever ends (21) with a corresponding operating force on the door grip can be displaced outwards against the force of a spring. In the inner space (3) of the door an operating part (8) coupled with at least one of the pivot levers (6) is adjusted and is connectable with a lock positioning component. The grip flap (18) is connected with the pivot levers via lever-shaped arms (20). The lever-shaped arm is pivotable around an axis (22) arranged on the pivot lever end against the rotary direction of the pivot lever into a favourable grip operating position. The basic body (2) has a guide (29) on which the lever-shaped arm rests on drawing out the grip flap from the rest position into a second end position during a predetermined pivot path section.
