Abstract (en)

[origin: EP0748662A1] The method involves measuring the bending angle of a bending former, generating a demand value ( $F_s$ ) for the feed force from the measured bending angle ( $\alpha$ ), determining the actual value of the feed force and varying the pressure in a hydraulic cylinder (22) so that the actual value of the feed force follows the demand value. The actual value of the feed force is measured by determining the pressure ( $P_1, P_2$ ) in the cylinder on both sides of a piston (23) and determining the force from the pressures taking into account the sizes of both piston surfaces.
