Abstract (en)
[origin: EP0748689A2] The system consists of a network linking printing facilities and customers. The network contains at least one data processor into which can be written information about the free capacity of the printing facilities. Information about the printed products to be generated is written into the data processor from the customer side and the information is processed to determine in which print facility the product will be printed. Information about a future printing product is written into the data processing system in the form of a requirement profile. The information in the data processing system about the free capacity of the printing facilities is continually updated.
