Abstract (en)

[origin: EP0748732A1] The operating and holding device is mainly for protective hoods and doors of cable railway systems. It includes an operating device which is controlled from the entry and exit stations, a transmission element (11) linking the operating device to the protective element (5), and a holder to keep the protective element open or closed. The holder consists of a crank lever (14). One of its arms is connected in its end zone to the end of the transmission element. There is a roller (20) able to turn on the pivot of the lever, acted on by a bolt turning on the protective element at a clearance from its turning axis.
